Context: video presentation of securely and cheap method of morcellation in laparoscopic myomectomy cases.

Objective: to show a video for safely morcellation technique within a surgical glove

Methods: Instructional video demonstrating the technique step-by-step.

Patient: A 35 years-old woman underwent laparoscopic myomectomy

Intervention: We use a surgical glove inserted to the abdominal cavity in the usual manner. The specimen was placed into the glove. The thumb of the glove was exteriorized through the umbilical trocar, and then the optical trocar was replaced into it. The mouth of the glove was also exteriorized from the left lower abdominal trocar in which the morcellation device was placed. Afterthat, insufflation of the surgical glove and power morcellation was performed.

Main Outcome Measure: None

Result: Morcellation of the specimen was completed using the enclosed surgical glove Therefore, spillages of the tissue fragments were eliminated.

Conclusions: The presented technique is feasible, efficient, safe and cheap.
